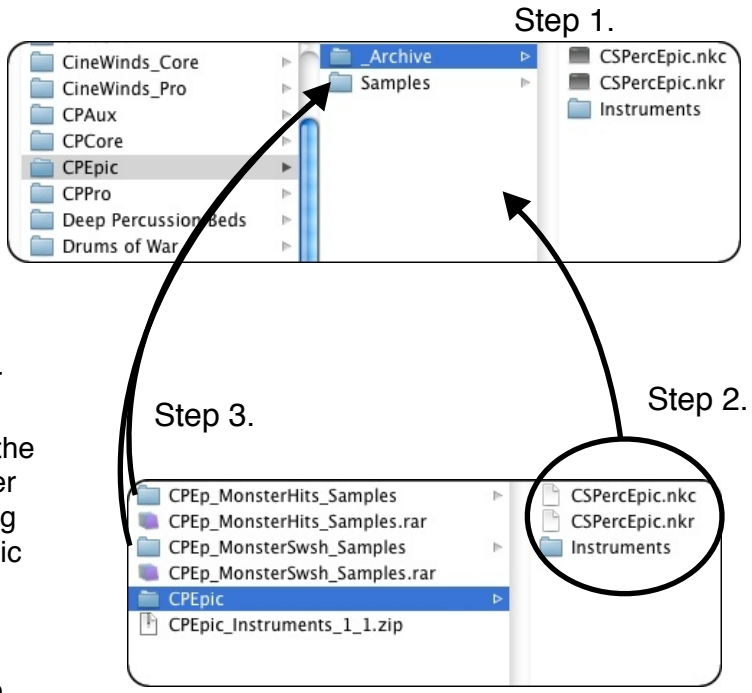
Installing Your Cinesamples Product - CinePerc Epic 1.1 Update

Backing Up

Before bringing in the new CinePerc 1.1 materials, we need to back up the version you currently have in case you ever need it for loading your old projects. In your Current CPEpic folder, make a backup folder and drag everything but the Samples folder into it.

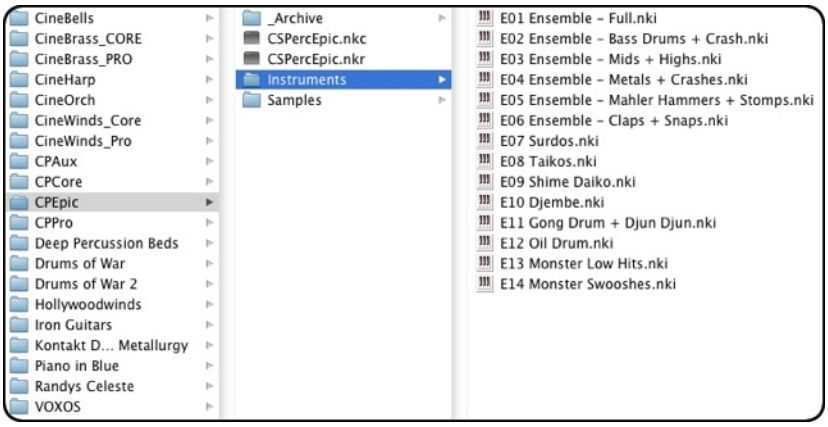
The result should be that your main CPEpic folder will only have a backup folder and a Samples folder on its first level, as seen to the right. Call the backup folder whatever you like; here it's called "_Archive"

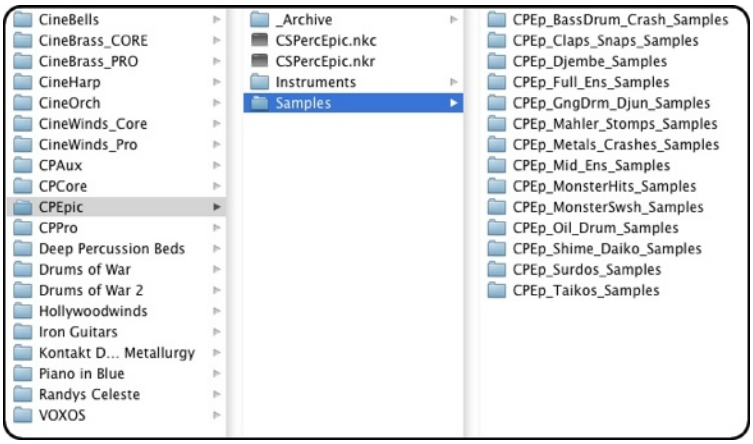


Installing

Next look in your Downloads folder (or the place that your browser sends your downloads) and find "CPEpic_Instruments_1_1.zip" Expand the zip to create the folder that contains the new patches and script. The folder that comes from the zip file is simply called "CPEpic" Drag the contents of this folder into your already existing CPEpic folder. Now the folder that the zip file made is empty and can be discarded.

Next expand each of the two rar files. This will create two sample folders to be used by the new patches included in version 1.1. Drag these two folders to the Samples folder in your original CPEpic folder. It should look like the pictures below afterwards.





Then you're all set! Restart Kontakt and enjoy CinePerc 1.1!
